The aim of this publication is to give a summary of the data currently available in the Food: "from farm to fork" database. The outline follows the approach followed by the European Commission within the Food Safety Policy and therefore, all indicators presented have been built keeping this in mind and cover food and feed. This publication provides the reader with statistical information to understand how the food chain evolves in Europe, giving different indicators on each step of the production-consumption chain.

This publication may be viewed as a compendium of data available on food and the food chain within Eurostat. However, it is not an exhaustive collection; rather it can be seen as a showcase for the various data sets that currently exist. Only statistics providing information on food products and food production chain aspects that have been considered relevant for food safety purposes are included. The data focus is on the 25 European Union Member States. Data for Candidate and EFTA countries have also been incorporated.

This pocketbook, intended for both generalists and specialists, is divided into five parts according to the main steps and aspects of the food production-consumption chain. The first part presents key indicators of inputs into this food chain, such as the inputs into the agriculture and the imports from third countries. Imports are measured in terms of extra-EU imports volume by main food products and main partners' countries. Part 2 looks at the food production composition distinguishing crop production, livestock and fisheries. Part 3 follows with data on production of processed foodstuffs, balanced with external trade statistics, and products with distinctive marks. In part 4, availability of food for human consumption, prices of food products and health statistics are presented. Finally, part 5 gives a statistical overview of the actors involved in the food chain. This part presents data on food primary production actors, food processing actors and food distribution actors. In annex, a glossary of terms and a methodological review of the classifications used in this publication are provided.

**Notice to the reader:**

*Tables and figures in this publication refer to data available in the Eurostat database FOOD as of 15 September 2005. Since the database is regularly updated as and when data are received and validated, data extractions made or requested subsequently may differ somewhat to those available at the time of publishing. The data are available on the Eurostat web site at:*

# *1. INPUTS INTO THE FOOD CHAIN*

This chapter presents indicators on key inputs in agriculture, including feedingstuffs, seed, fertilisers and pesticides, and also on the quantities of food products imported by the European Union from the rest of the world.

The value of intermediate consumption in agriculture over the period 1993-2004 showed a noticeable increase (over 25%) in expenditure on seed and planting stock, plant protection products and veterinary items.

Turning to EU-15 food products imports from third countries, cereals and cereal preparations represented the largest category in 2004 with 14.1 million tons. The USA, which accounted for almost 60% of EU-15 imports of cereals and cereal preparations in 1995, has been the main EU-15 partner for this item for the past ten years; however, in 2004, its share in EU-15 imports decreased to 18% to the advantage of other countries such as Canada (17%), Argentina (12%) and Brazil (12%). Imports of meat and meat preparations to the EU-15 from third countries increased from 910 thousand tons in 1995 to 1 481 thousand tons in 2004, representing a 5.6% average annual increase over the 1995-2004 period. Ten years ago, half of EU-15 imports came from New Zealand (24%), Argentina (15%) and Brazil (13%). Brazil considerably raised its share and by 2004 supplied more than one third of all EU-15 meat and meat preparation imports (37%), followed by New Zealand and Poland which supplied 14% and 10% respectively. As regards feedingstuffs, more than 80% of the total EU-15 imports in 2004 originated from Argentina (35%), Brazil (32%) and the USA (15%).

Evolution of intermediate consumption (basic prices) in agriculture in the EU-15, 1993-2004 (1993=100)

Source: Economic accounts of agriculture

Figure 1.1.2 Value of intermediate consumption (basic prices) in agriculture in the EU-25. Contribution of some selected inputs, 2004 (%)

Source: Economic accounts of agriculture

Intermediate consumption represents the value of all goods and services used as inputs in the production process, excluding fixed assets whose consumption is recorded as fixed capital consumption. Various items enter into intermediate consumption in agriculture. These are: seeds and planting stock; animal feedingstuffs; fertilizers and soil improvers; plant protection products and pesticides; energy and lubricants, e.g. electricity, gas and all other solid and liquid fuels and propellants; maintenance of materials and buildings; agricultural services and other goods and services, e.g. fees for membership of professional associations, fees for agricultural consultants, purchases of services of market research and advertising, purchases of small tools, etc.

The first four items represented some 60% of the overall intermediate consumption in agriculture in EU25 in 2004. Feedingstuffs accounted for almost two thirds (65%) of them while only 5% were dedicated to veterinary expenses, after fertilisers and soil improvers (12%), plant protection products (10%) and seeds and planting stock (9%). Among the 65% share of intermediate inputs represented by feedingstuffs, 37% were purchased outside the agriculture industry while 24% were produced and consumed by the same holding. The remaining 3% were supplied by other agricultural holdings.

## *2. PRIMARY PRODUCTION*

Chapter 2 looks at food production in agricultural holdings, including some statistics on organic livestock, and at fishing activities. Primary production is measured in terms of the value of agricultural output and production volume by category.

Cattle breeding experienced a fairly constant decline between 1994 and 2004 (-10% over this period at the level of the EU-15). At EU-25 level in 2004, 86 million heads were counted. France registered 19 million heads, Germany 13 million and the United Kingdom 10 million. Meanwhile, an increase in laying hens (+ 2% between 1994 and 2001) and pigs (+ 5% between 1995 and 2004) was recorded. In 2003, 125.8 million tons of milk was produced at the farm in the EU-15, of which 55% came from three countries: Germany (28.6 million tons), France (25.5 million tons) and the United Kingdom (15.0 million tons).

Looking at fishery activities, Atlantic herring was the species destined for human consumption with the highest volume of catches (673 thousand tons of live weight) in the EU-25 in 2003. This fish species was caught exclusively in the North-East Atlantic, as were Atlantic cod, haddock, European plaice and whiting. Likewise, more than 80% of albacore, Atlantic mackerel and common sole came from this fishing area. The East Central Atlantic provided skipjack and yellowfin tuna, while European anchovy and Atlantic bluefin tuna were caught mostly in Mediterranean waters.

Regarding aquaculture production, total fishery products (including species not used for human consumption) rose from 970 thousand tons of live weight in 1993 to 1.4 million tons in 2003, blue mussel accounting for one third of the total production. Whereas Spain accounted for 13% of EU-25 aquaculture production in 1995, in 2003 it became the first producer with 313 thousand tons, representing close to a quarter (23%) of EU-25 total production.

## ***3. FOOD PROCESSING***

Chapter 3 gives an overview of the production of some selected processed foodstuffs distinguishing some products with distinctive marks. Production is measured in terms of sold production, usable production or production for sale, and figures are presented balanced with external trade statistics for main processed foodstuffs categories. Products with distinctive marks include quality wine production.

Production and trade of food products varies considerably between countries. Looking at meat products, France produced the largest volume of fresh or chilled cuts of beef and veal among the EU Member States with 577 thousand tons followed by Germany (336 thousand tons) and the Netherlands (183 thousand tons). On the other hand Spain produced the largest volume of fresh or chilled pork other than hams, with 1 099 thousands of tons while Germany was the main producer of sausages not of liver with a volume of 1.4 million tons.

Wine production in the EU-15 amounted to 153 million hectolitres in 2004, of which 62 million litres were of quality wine, 92 million litres of table wine and 8 million of other wine. France was the main producer with 46.4 million hectolitres, relatively closely followed by Italy (44.1 million hectolitres) and Spain (40.8 million hectolitres). Together, they accounted for 86% of the total EU-15 wine production. France was easily the leading producer of quality wines with 22.4 million hectolitres (36% of the total EU-15 quality wines). Italy and Spain produced the largest shares of table wines (43% and 31% of the EU-15 total respectively). Regarding external trade, Germany and the United Kingdom were the largest importers of wine in the EU-15 in 2004 with 13.5 million litres and 12.5 million litres respectively.

At EU-25 level, the sold production of mineral and aerated waters was nearly forty times higher than that of non-alcoholic beverages containing milk fat (43.1 and 1.1 billion litres respectively). Extra-EU-25 imports of mineral and aerated waters represented 188.8 million litres but extra-EU-25 exports accounted for more than 6 times that volume (1 235.0 million litres). France was the country exporting the greatest volume with 2.7 billion litres, although regarding sold production, this country was behind Italy and Germany. The leading producer of non-alcoholic beverages containing milk fat was Spain with a sold production volume of 492.1 million litres, followed at a distance by Germany with 161.2 million litres.

Table 3.1 Sold production and external trade of cereal products, 2004 (1 000 Kg)

## ***4. FOOD CONSUMPTION AND HEALTH***

Chapter 4 takes a closer look at food consumption statistics and health-related indicators. The data offer an insight into the gross apparent human consumption of main food items, the accessibility of food to consumers and consumers' health. It is important to note that gross apparent human consumption data come from the Supply Balance Sheets that estimate food availability to the consumer and not actual consumption by households. In this section, the degree of self sufficiency is outlined as well as the relative price levels of food products. Some indications of consumers' health issues are given by looking at reported cases of some food-borne and water-borne infectious diseases.

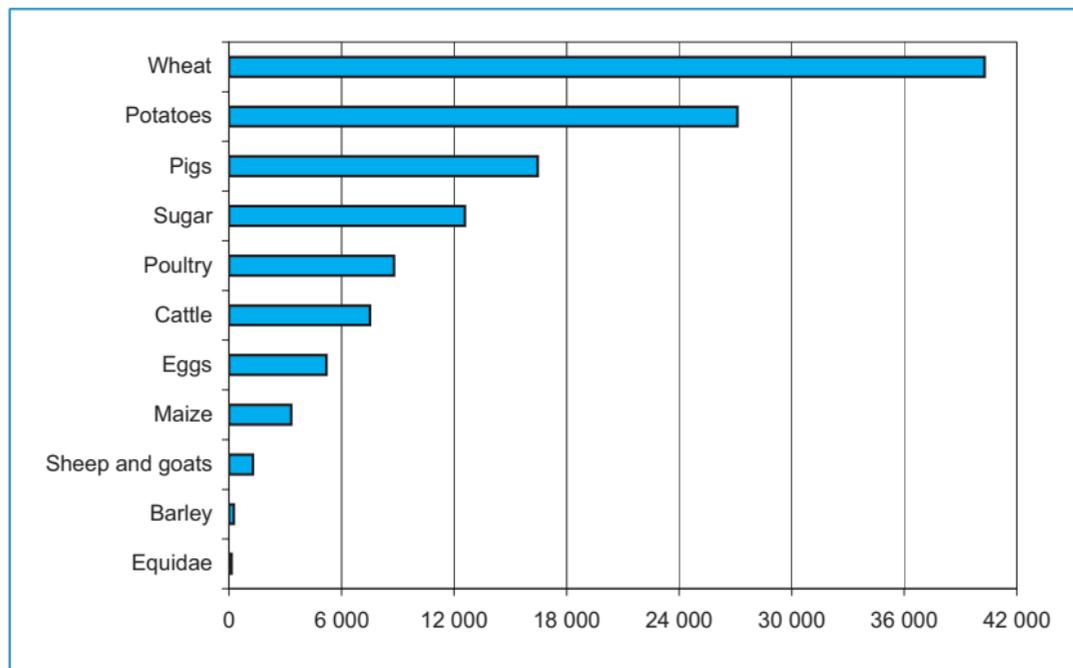

Among the main food items, wheat, potatoes and pork registered the highest apparent consumption in the EU-15 in 2002 with 40.3 million tons, 27.1 million tons and 16.5 million tons respectively. Looking in more detail at wheat consumption, Greece, with 188 kg available per person, was considerably over the EU-15 average of 106 kg per person. As regards potatoes, they were particularly consumed in Poland (130 kg/person) and Ireland (128 kg/person). With 74 kg per person, Denmark was the largest consumer of pork, the EU-15 average only being 43 kg/person.

In 2004, the EU-15 was self-sufficient for most crop products, apart from maize and dried pulses. However some countries such as the Netherlands, Portugal and Belgium displayed less than 50% self-sufficiency for cereals. The EU-15 is also self-sufficient regarding meat. Denmark (329%) and Ireland (272%) in particular - and to a lesser degree the Netherlands (188%) and Belgium (166%) - produce substantially more than they consume.

Prices of food products were particularly high in Denmark: in 2003 their level was 30% above the EU-15 average. As regards alcoholic beverages, prices were more than 25% higher than the EU-15 average in Northern countries such as Denmark (+27%), the United Kingdom (+46%), Sweden (+47%), Finland (+76%) and Ireland (+77%). However, Cyprus too displayed high prices for this item, being 45% above the EU-15 average. Between 1996 and 2004, prices increased for all food products (+18%) and beverages (+7% for non-alcoholic beverages and +13% for alcoholic beverages) in the EU-25.

## 4.1 Gross human apparent consumption of main food items

Figure 4.1.1 Overview on gross human apparent consumption in EU-15, 2002 (1 000 t)

	Volume (1 000 t)	Annual growth rate 1995-2002 (%)
Wheat	40 272	1.4
Potatoes	27 096	-0.3
Pigs	16 465	1.0

Figure 4.1.3 Average annual growth rate of gross human apparent consumption of wine, EU-15, 1991-2004 (%)

(1) The figures per head are calculated using the population resident in one country. These figures can be biased by the consumption of the population beyond national borders. This is the case in the smallest countries with relative price differentials in some products, e.g. Luxembourg.

## ***5. ACTORS IN THE FOOD CHAIN***

This chapter looks at the actors involved in the food chain. It shows statistics related to the utilised agricultural area, including organic areas fully converted and under conversion, as well as the number of holdings by crop type. Information is also provided on the number of enterprises, employment and turnover for manufacturing, retailing and restaurants, bars and canteens.

In 2003, the Utilised Agricultural Area (UAA) in the EU-15 represented 126 millions hectares, with an average holding size of 20 hectares. Organic areas, fully converted and under conversion, were mainly present in Austria (10% of the UAA) and Italy (8% of the UAA), whereas the EU-15 percentage in 2003 was below 4%.

The manufacturing of food products and beverages employed 4.4 million persons in the EU-25 in 2002, 22% of which were employed in the processing of meat. The meat processing sector generated a turnover of EUR 158.4 billion in the EU-25 in 2002, corresponding to one fifth of the total recorded for food and beverages manufacturing.

There were some 472 thousand enterprises specialised in food retailing (NACE Group 52.2) in the EU-25 in 2002. These specialised food retailers include fruit and vegetable shops, bakers, butchers and fishmongers.

Restaurants, bars and canteens employed 5.7 million persons in the EU-25 in 2002, 25% of which were employed in the United Kingdom alone. The turnover of the United Kingdom represented one fourth of the EU-25 turnover though this country accounted only for 9% of the EU-25 enterprises.

## 5.1 Food primary production actors

# ***GLOSSARY***

**Active ingredient:**

Active ingredients are the substances in a commercial product which cause the desired effect on target organisms (fungi, weeds, pests, etc.).

**Agricultural holding:**

The agricultural holding concept in agricultural statistics is used in the Farm Structural Survey (FSS). It is defined as a single unit both technically and economically, which has a single management and which produces agricultural products. The holding may also provide other supplementary (non-agricultural) products and services.

**Average annual growth rate:**

Year over year growth rate over a specified period of time. It is calculated by taking the nth root of the total percentage growth rate where n is the number of years in the period being considered. It is expressed as a percentage.

**Basic price:**

The basic price is the amount receivable by the producer from the purchaser for a unit of a good or service produced as output minus any tax payable, and plus any subsidy receivable, on that unit as a consequence of its production or sale; it excludes any transport charges invoiced separately by the producer.

**Consumer Price Indices (CPIs):**

Economic indicators constructed to measure the changes over time in the prices of consumer goods and services acquired, used or paid for by households.

**Degree of self sufficiency:**

The degree of self-sufficiency of a given region indicates up to what point "domestic production" (from a domestic raw material) of this region is in a position to cover all the needs or "domestic use" (total use for humans, animals and industry) of this region. With regard to the balance sheets, the degree of self-sufficiency is calculated by Eurostat using the "domestic use" as with the "domestic production" quotient.

**Exports:**

The data are taken from official external trade statistics, which relate to all goods. For an individual country, the term refers in this publication to all outward flows of goods leaving the territory of the country and includes intra-Community trade and trade with third countries. For the EU aggregates the term refers to all goods leaving the statistical territory of the Community (trade with third countries).

**Extra-EU trade:**

Extra-EU trade statistics cover the trading of goods between a Member State and a non-member country. Extra-EU trade statistics do not record exchanges involving goods in transit, placed in a customs warehouse or given temporary admission.

**Extra-EU imports** are recorded at the frontier country where the goods are placed under the customs procedures.

**"Food-borne" diseases:**

Food-borne illnesses are defined as diseases, usually either infectious or toxic in nature, caused by agents that enter the body through the ingestion of food.

**Gross human apparent consumption:**

Quantities of products made available for human consumption in all forms: quantities consumed without further processing and quantities supplied by the distributive trades and the food industry. It is a derived statistic obtained from the Supply Balance Sheets and calculated as (commercial production + estimated own account production for self consumption + import + opening stocks) - (exports + usage input for processed food + seed + feed + non-food usage + wastage + closing stocks).

**Harmonised indices of consumer prices (HICPs):**

Harmonized Indices of Consumer Prices are designed for international comparisons of consumer price inflation. They are used in the assessment of inflation convergence as required under Article 121 of the Treaty of Amsterdam (Article 109j of the Treaty on European Union).

The coverage of the HICPs is defined in terms of 'household final monetary consumption expenditure', by reference to the national accounts concepts of the European System of Accounts (ESA 1995). Expenditures are classified according to the COICOP/HICP (Classification Of Individual Consumption by Purpose adapted to the needs of HICPs) available from the RAMON database of classifications (access from Eurostat's home page).

**Imports:**

The data are taken from official external trade statistics, which relate to all goods. For an individual country, the term refers in this publication to all inward flows of goods entering the territory of the country and includes intra-Community trade and trade with third countries. For the EU aggregates the term refers to all goods entering the statistical territory of the Community (trade with third countries).

**Organic operator:**

Any natural or legal person who produces, prepares or imports from a third country with view of the subsequent marketing thereof organic products or who markets such products, following the rules of the Council Regulation (EEC) N° 2092/91 on organic farming.

**Organic producer:**

Any natural or legal person who operates an agricultural holding involved in producing, packaging and labelling of his own organic products following the rules of the Council Regulation (EEC) N° 2092/91 on organic farming.

**Organic processor:**

Any natural or legal person who preserves and/or processes organic agricultural produce (including slaughter and butchering of livestock) following the rules of the Council Regulation (EEC) N° 2092/91 on organic farming. The packaging and labelling of organic products is also considered as processing.

**Organic Importer:**

Any natural or legal person who imports organic products from a third country with a view to the subsequent marketing of these products.

**Organic farming:**

Organic farming can be defined as a method of production which places the highest emphasis on environmental protection and, with regard to livestock production, animal welfare considerations. It avoids or largely reduces the use of synthetic chemical inputs such as fertilisers, pesticides, additives and medicinal products. The Regulation (EEC) N° 2092/91, defines in detail the requirements for agricultural products or foodstuffs bearing a reference to organic production methods. It notably defines a method of agricultural production for crops and livestock, and regulates the labelling, processing, inspection and marketing of organic products within the Community, and the import of organic products from non-member countries.

**Organic area:**

Sum of fully converted organic areas and areas in conversion.

**Price Level Indices (PLI) (EU 15/25=100):**

These are the ratios of PPPs (Purchasing Power Parities) to exchange rates. By expressing the PPPs in a common currency unit, they provide a measure of the differences in price levels between countries by indicating for a given product group or aggregate the number of units of the common currency needed

to buy the same volume of the product group or aggregate in each country . At the level of GDP they provide a measure of the differences in the general price levels of countries.

**Production for sale:**

Volume of the product manufactured by the enterprise during the survey period and intended for sale.

**Purchasing Power Parities (PPPs):**

Purchasing Power Parities are spatial price indices, which, just as temporal price indices allow making real/volume comparisons in time, are designed to make real/volume comparisons in space or across countries. Therefore they are key statistical tools for international volume and price level comparisons.

**Sold production:**

Volume of the product sold by the enterprise during the survey period.

**Usable production:**

This heading comprises all usable quantities obtained from the production process, including the quantities used for "own consumption" by producers. Losses occurring during the production process, e.g. harvest losses in the field, are not included.

**Utilised Agricultural Area (UAA):**

The Utilised Agricultural Area (UAA) is the total area taken up by arable land, permanent grassland, permanent crops and kitchen gardens.

**"Water-borne" diseases:**

"Water-borne" diseases are defined as the diseases commonly transmitted through contaminated water supplies. It includes diarrhoea, cholera, typhoid, poliomyelitis and hepatitis A.

# *SOURCES AND CLASSIFICATIONS*

## Sources

### PRODCOM

PRODCOM is a survey to collect statistics on the amount of production that has taken place in the reporting country during the reference period. The title comes from the French "PRODUCTION COMMUNAUTAIRE" (Community production).

The PRODCOM survey is based on the PRODCOM List, consisting of about 5000 products. The PRODCOM codes normally relate to one or more Combined Nomenclature (CN) headings, thus enabling external trade data to be related to production data (see correspondence tables in RAMON).

### Supply Balance Sheet:

The supply balance sheets are used to compare the resources and uses of a product (or group of products) in a reference area (Community and/or Member States) and a reference period (calendar and/or crop year). Experience has shown that absolute data on stocks are not always available and they are therefore replaced throughout by data on the change in stocks, giving the following practical layout:

Resources = Usable production + Imports

Uses = Exports + Change in stocks (+ or -) (closing stocks - opening stocks) + Domestic Uses

where Resources = Uses

### Farm Structural Survey (FSS):

Farm Structure Survey data are used to collect information on agricultural holdings in the Member States at different geographic levels (Member States, regions, districts) and over periods (follow up the changes in agricultural sector), thus provide a base for decision making in the Common Agricultural Policy. The FSS are organised in all Member States on a harmonised base.

### External trade statistics

The compilation of external trade statistics is divided into two different statistical systems: extra-EU trade statistics (Extrastat) and intra-EU trade statistics (Intrastat). Extra-EU trade statistics cover the cross-border trading of goods between Member States and non-EU countries and intra-EU trade statistics cover the trading of goods between Member States. This conceptual separation is mainly due to different data collection instruments, but it is as well a result of diverging policy impact. Whereas extra-EU trade statistics are required for a common trade and customs policy of the Community, intra-EU trade statistics measure the integration of the Member States in a common market.

## Classifications

For more details regarding the classifications and codes used in this publication, please refer to RAMON, Eurostat's Classification Server (<http://europa.eu.int/comm/eurostat/ramon>).

### Combined Nomenclature (CN)

The Combined Nomenclature (CN) is the European Community's classification of goods, which meets requirements in terms of external trade statistics (both intra- and extra-Community) and the customs tariff within the meaning of Article 9 of the Treaty establishing the European Economic Community.

### Standard International Trade Classification (SITC)

The SITC is a statistical classification of the commodities entering external trade designed to provide the commodity aggregates needed for purposes of economic analysis and to facilitate the comparison of trade-by-commodity data.

The products are classified in categories on the basis of divisions (two-digit codes) of the Standard International Trade Classification (SITC Rev. 3). Detailed food products data are disseminated according to the most detailed level of the Combined Nomenclature (CN). For this reason, tables of this publication detail both classification codes by food product category, SITC and CN. Nomenclatures and correspondence tables are available at the Eurostat's classification server RAMON.
